

# Allele

## mNG-nAb™ Agarose

Optimized by the research scientists at Allele Biotechnology, mNG-nAb™ is a highly specific mNG (mNeonGreen) binding protein derived from camelids. It is characterized by a small size (13 kDa) and a very high stability (stable up to 70°C, functional in high salt concentrations or 0.5% SDS). One molecule of mNG-nAb™ binds one molecule of mNeonGreen with a dissociation constant (Kd) in the sub-nanomolar range. This makes mNG-nAb™ agarose resin the ideal candidate for a variety of biological assays.

mNG nAb™ is an excellent antibody for immunoprecipitation, and should make mNG a very useful tag for immunoprecipitation assays.

### mNeonGreen

mNeonGreen is the brightest monomeric green or yellow fluorescent protein to date, and is an excellent fusion tag for traditional imaging as well as stochastic single-molecule super resolution imaging. It is a stellar fluorescence resonance energy transfer (FRET) acceptor for cyan fluorescent proteins.

#### For Research Use Only. Not for Diagnostic or Therapeutic Use.

Purchase does not include or carry any right to resell or transfer this product either as a stand-alone product or as a component of another product. Any use of this product other than the permitted use without the express written authorization of Allele Biotech is strictly prohibited.

### Applications

- Immunoprecipitation / CO-IP
- Quantitative analysis
- Chromatin Immunoprecipitation (ChIP)
- Identifying Interacting Proteins
- RIP Assays (RNA Immunoprecipitation)
- CLIP Assays (in vivo Cross Linking and Immunoprecipitation)

### Product Info

Cat.#	Qty
<b>mNeonGreen nAb™ coupled to Agarose Beads</b> Provided as a slurry in PBS pH 7.4 with 20% ethanol Binding capacity - minimum 5ug mNG per 10ul of slurry	
<b>ABP-nAb-MNGA025</b>	250 µl (10 rxn)
<b>ABP-nAb-MNGA050</b>	500 µl (20 rxn)
<b>ABP-nAb-MNGA100</b>	1.0 ml (40 rxn)
<b>mNeonGreen nAb™ purified protein</b>	
<b>ABP-nAb-MNGAB</b>	250 µl (1mg/ml)
<b>mNeonGreen nAb™ Kit</b>	
<b>ABP-nAb-MNGAK20</b>	20 Reactions
<b>Kit Contents</b>	
<b>Wash Buffer</b> <b>Lysis Buffer</b> <b>20 Spin Columns</b>	<b>Binding Buffer</b> <b>Elution Buffer</b> <b>Neutralization Buffer</b>

Store at 4°C

### Technology

Antibodies - extremely powerful tools in biomedical research - are large complex molecules (~ 150 kDa) consisting of two heavy and two light chains. Due to their complex structure, the use of antibodies is often limited and hindered by batch-to-batch variations.

Camelidae (camels, dromedaries, llamas and alpacas) produce functional heavy chain antibodies (hcAbs) devoid of light chains. hcAbs recognize and bind their antigens via a single variable domain (VHH). These VHH domains are the smallest intact antigen binding fragments (~ 13 kDa).
